

## FSX ILS Tutorial

Make sure the FD switch is in the ON position

Now you need to get takeoff clearance and take off

When you get near your destination you will get a message from ATC saying something like this: 'Boeing123, Turn heading 152 expect vectors ILS runway 9L approach'.

Next turn to the heading they said eg.152 and remember the runway they said for example 9L

Open the map and click your destination airport. Find your runway heading and frequency.

Put the frequency into the NAV 1 section of the radio stack

Put the heading you got into the Course selector on the Autopilot panel

Keep on flying until you get a message from ATC saying something like 'Boeing123, you are 21 miles north west, turn heading 145 you are cleared ILS runway 9L maintain 2,000 until established on the localizer'.

Just turn to the heading they said and descend to the altitude they said. Also press the APP button on the Autopilot.

The plane should now land itself. Just disengage the Autopilot before touchdown. Don't forget to lower the landing gear and deploy flaps!
