

FSX Takeoff Tutorial

First set your flaps to about degree 5

Next get takeoff clearance and taxi onto the runway

Now switch on the Landing lights and the strobe lights whether its night or day

Now were ready to takeoff, push the thrust lever to about 70% for about 4 or 5 seconds and check that both engines are stabilized (that there both at the same values)

Now push it to 100%. At about 120 rotate (pull the nose up) to about 15-20 degrees.

Once the aircraft is off the ground pull the gear lever up to pull the wheels up

And that's it for the takeoff!
